

The Future Relationship Production and Consumption of Energy and the

Global Warming Crisis

Abstract

The human society is moving towards a human catastrophe, and the cause of this is the economic growth of different countries of the world, and the increase in production and consumption of energy without considering environmental issues; thus, the whole of human

Shahrekord University

society is in serious threat of extinction. Consequently, in the next 5 years, several countries shall become uninhabitable for human beings, and in the next 10 years, this catastrophe would affect most of human life and the world, as a whole. However, this is an issue that energy producers should also pay attention to because there is no longer a consumer for whom they can produce energy. This paper offers solutions that would not stop the economic growth but offer more time to all nations by reviving the environment to reform their energy production and consumption systems and reducing or stopping their greenhouse gas emissions. However, these solutions are called "Plan to Increase the Amount of Rainfalls". The project aims to provide the essential freshwater to carry out the green movement (rangeland and forestry) to deal with the global phenomenon of global

Recommended Solutions

1. Plan to Increase the Amount of Rainfalls: "Plan to increase the number of rainfalls" can be accomplished in a few number countries and it can be implemented in approximate parts of the world that have a temperature above 60 degrees Celsius. In this plan by transferring water from seas and oceans to the margins of very hot deserts and use the advantage of the hot deserts to create conditions that cause clouds to rain. Obviously, the design of this plan to rain is suitable for the cold seasons of the year namely autumn and winter. **Fig. 3.** (a) TX90p and (b) TN10p average time series for Australia, North America, Europe, Asia, and the globe. Only grid boxes which have data for 90% of the years are included when calculating the global average [2].

Conclusion

The current state of human life - which has done with produce and consumption of energy for its various welfare, regardless of environmental issues- is moving in a direction where human catastrophe is imminent for all human life. However, the whole world must take the necessary action to revive, strengthen and grow the environment by carrying out a "Plan to Increase the Amount of Rainfalls" to prevent the annihilation of the economy and human beings. The international awareness community to carry out environmental rehabilitation projects is one of the requirements that all human society should follow up on.

warming.

Keywords: Plan to Increase the Amount of Rainfalls; Local Precipitation Increasing Project; Additive Effects; Green Campaign.

State the problem

TheFutureRelationshipProductionandConsumptionofEnergyandtheGlobalWarmingCrisis:

In less than 5 years, the contemporary environmental situation in different countries of the world would make the possibility of human life impossible due to global warming in some countries of the world. However, in the next 10 years, the number of uninhabitable countries shall increase and in general, human lives are threatened. To deal with the phenomenon of global warming, two comprehensive plans are defined which aim to provide the essential freshwater to carry out the green movement (rangeland and forestry) to deal with the global phenomenon of global warming: 2. Local Precipitation Increasing Project:

The aforementioned plan is not applicable in all regions. For this purpose, a "Local Precipitation Increasing Project" is presented to increase the amount of rainfall in the other world. This plan uses electric motors to produce artificial clouds and fog, to produce the necessary conditions for rainfall.
